

CVBench accuracy vs. frame budget, by task category (2×2-stitch, InternVL3-8B)

Overall flat then falling; temporal-ordering tasks degrade with more frames, spatial navigation improves — all well above chance.

1000 CVBench questions × 4 passes; bands = ±1 std across passes. Effective fps = frames ÷ 300s clip.

Dashed = chance, the score of a uniform random guesser: mean over that category's questions of 1/(number of answer options).
